

four slides, one tissue type

variance in expression, on audited donor labels

Left: spot bootstrap, 200 resamples, seed 1 -- the same resampling that produced the stored standard errors, verified to reproduce them exactly. Between-slide spread is 0.486 against a widest interval of 0.095, and 3 of 3 adjacent pairs are disjoint. Squares are the superseded round-1 morphology build, which reads 0.458 on the top slide where the outline quotes 0.46. Right: method-of-moments components on the R5b audited donor labels, with the pooled between-donor share over the two tasks having $df_{\text{donor}} \geq 3$ marked; ▲ marks $df_{\text{donor}} \leq 1$, where the between-donor share is one contrast rather than an estimate, and • marks a task whose donor labels are not fully verified.
